

**THE ART OF
MODDING** ■

Introduction

By visiting the **ModHub** on the official Farming Simulator website (www.farming-simulator.com/mods), you can get access to the community's player-created content.

These modifications, or **mods**, are created with the GIANTS Editor which conveniently comes with the PC version of the game.

Whether it is a new tractor, a different game environment, or new features - there is something for everyone. The options are nearly limitless and once you start modding it's hard to let go!

Importing assets

External assets which are saved in an I3D or FBX format can be imported and placed in your own game environment. This makes it possible to use existing objects from other maps or mods or to import something completely new with 3D software like Blender, Maya, or 3ds Max.

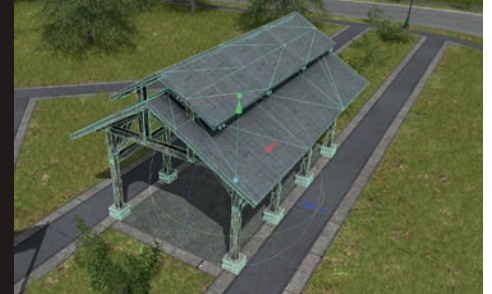

Maps

The game environments in Farming Simulator are also called **maps** and they can be modified with the GIANTS Editor. Map mods are a fantastic way to get into modding because you can get inspirations from the world around you. You can make changes to existing maps or create a completely new environment. Create a fantastic, lush, forest or recreate your own back yard!

Placing objects

With just a few button clicks it is possible to **reposition** objects on a map. You can move bushes or whole buildings with this function.

Duplicate objects

You don't have to build an object from scratch every time if you want to use it in the game world. A quick and effective solution is to simply **duplicate** the object and then move the copy.

Duplicate with rotation

For a more natural look you can activate the function to **randomly rotate duplicated objects** whenever you place them on the map.

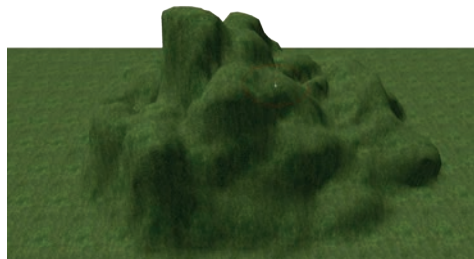

Editing terrain

With the GIANTS Editor you can literally move mountains! You are only limited by your imagination, you can sculpt the terrain to create wide open plains or steep valleys. Here are some examples of the various tools available:

Add

Raises the terrain to create hills or mountains.

Subtract

Lowers the terrain to create trenches or valleys.

Erosion

Gives terrain a more natural look through simulated erosion.

Paint Textures

Apply textures on the terrain surface to create roads, rock, or soil.

Ground Details

Use Foliage Mode to create the Fields, setting where you want farmable areas in your customized map.

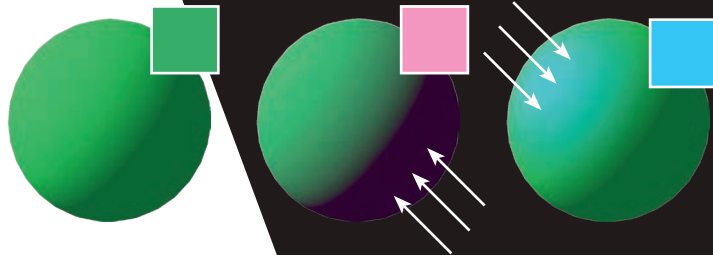

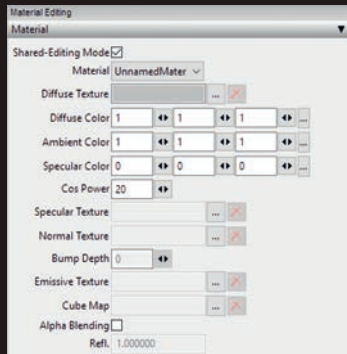

Paint Foliage

Using this tool you can place some plants in the growth state of your choice on fields. Plants on fields which aren't owned by the player can also help to make the map look and feel more realistic.

Material Panel

Use the material panel to change the texture and attributes of a material which affects how the model's surface looks in the virtual world.

Diffuse Color

Ambient Color

Specular Color

Texture types

The GIANTS Editor lets you view and adjust the textures of 3D objects.

Diffuse Texture Map

Defines variable diffuse colors instead of a single solid color on an object.

Specular Map

Defines the gloss on the surface of an object.

Normal Map

Creates the illusion of more surface geometry and makes the object appear rougher or smoother than it actually is.

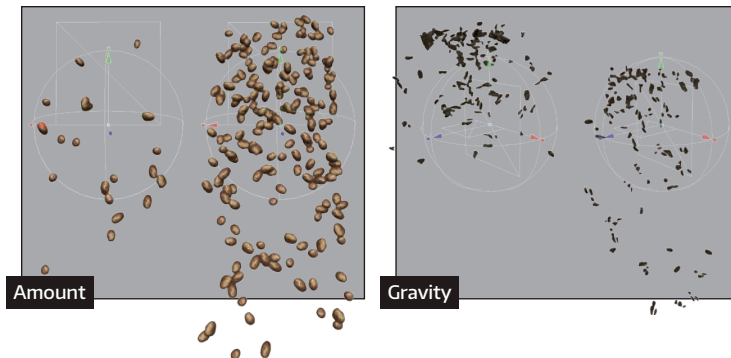

Particles

Particles are generated at runtime and make objects look more realistic.

Essentially it is an object which generates copies of small physically simulated 3D points, particles, emitting from its surface. An example of a particle effect is to simulate the dust of tires or the sawdust of a chainsaw.

Simulation and Spawn Parameters

A multitude of settings to adjust the speed, maximum number of particles, gravity, and other variables.

Creating Individual 3D Mods

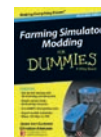

Completely new 3D objects can be created with 3D tools like Maya, Blender or 3ds Max. Additional tractors, tools or buildings can then be added to your Farming Simulator.

The options are nearly limitless and if you're now interested in shaping the game according to your imagination then you can find a more manuals and documentation here:
